

NAP – Grid Connection Planning Kamp

NAP is an engineering company, which specialises in renewable energy, including electrical engineering and networks operation. Since the beginning of 2017 the company has been active internationally.

Many years of experience and being the junction between equipment manufacturers, equipment certifiers (only in Germany), users and network operators, makes NAP an expert in the energy industry. Due to working as project developers and network operators, the company has precise knowledge on work and planning processes and offer its support in all areas of electrical planning/connection, including tendering, construction supervision and commissioning, as well as acceptance of substations or single components. Furthermore, NAP assists in the design phase of projects and offers services for grounding concepts and their measurements, also measures of control for non-compliance (national, international).

The business focus in New Zealand and Australia is to meet up with potential partners in the field of project development (renewable energy) as well as getting in contact with companies operating in the field of 'energy efficiency'. Another purpose is to connect with grid operators and getting further information about the energy market, the expansion of renewable energies as well as power grids (grid expansion and modernisation). Therefore, Mr Tobias Kamp, CEO, would like to meet with

- project developers
- sales and distribution persons
- funders and
- especially with project developers and grid operators to whom the services apply

in the sectors of energy efficiency and renewable energy to discuss business opportunities.

Further product and company information is available at
